Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

RESULT 1

The peptide is linked to a carrier protein via a linking agent and used to immunise mice. The mouse spleen cells and amyeloma cell line can be fused to produce a hybridoma secreting MADS which bind specifically to human fibrin but not fibrinogen. (Updated on 25-MAR-2003 to correct PA New anti-human fibrin mono:clonal antibody, for diagnosing thrombosis prepd. from hybridoma obtd. by applying cell fusion mouse spleen and mouse myeloma-cells, and measures human fibrin. Fibrin; beta chain; N-terminal; monoclonal antibody; thrombosis. Human fibrin beta chain N-terminal. (MITN) MITSUBISHI GAS CHEM CO INC. AAP82686 standard; peptide; 8 AA. AAR65789-R65794 are synthetic peptides comprising fibrin-specific epitopic sequences, they can be used to prepare hybridoma cell lines, which produce antifibrin-specific monoclonal antibodies substantially devoid of fibrinogen cross-reactivity. These antibodies are useful in the in vivo and in vitro detection of thrombi and fibrin deposits. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                Synthetic epitopic peptide(s) of variable length - capable of eliciting fibrin specific antibodies free of fibrinogen cross-reactivity.
                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 50; DB 2; Length 8; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                      Hybrid monoclonal antibody - used for prepn. of thrombolytic having drug increased thrombolytic activity and specificity and reduced reactivity to
                                                                                                                                                                                                                                                                                                                                                                                                                            t
                                                                                                                                                                                                                                                                                                                                                                                                                        Human fibrin beta-chain peptides A and B were synthesised and coupled to BSA for injection into mice. The peptides were used to raise antibodies to human fibrin. Monoclonal antibodies specific for fibrin are used in the production of bispecific monoclonal antibodies which also recognise truncated tPA muteins lacking the finger, EGF and Kringle I domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S

                                                                                                                               This sequence represents a synthetic beta-peptide which was used to immunopurify the monoclonal antibody 59D8 which was raised against beta-peptide (see also AR63269). The antibody binds fibrin and may be used in the chimeric molecule of the invention. The chimeric molecule further comprises a thrombin inhibitor linked to the fibrin-binding antibody through a covalent linkage. The chimeric molecule allows fibrin-specific antibody targetting of hirudin and other thrombin inhibitors, which is more potent than thrombin on its own. The epicope to which 59D8 binds becomes available only after thrombin cleaves fibrinopeptide B. The chimeric protein may be used for preventing coagulation of the blood. Anti-thrombin targetting can be esp. useful in highly thrombogenic situations such as coronary stent implantation and can be used as an adjunctive therapy with highly selective thrombin activity by the trombin inhibitor is localised to sites of thrombin activity by the antibody which binds to thrombin allows the total amount of fibrinogen. The selectivity of inhibition allows the total amount of thrombin inhibitor used to be substantially reduced, resulting in a produced thrombin inhibitor well and the substantially reduced. Tesulting in a produced to be substantially reduced, resulting in a produced to be substantially reduced. Tesulting in a produced the substantially resulting in a produced to be substantially resulting in a produced the substantially resulting in a produced the substantially resulting in a produced to stress the substant of the substantial produced to substantially resulting in a produced to substantially resulting in a produced to substantially resulting in a produced to be substantially resulting to the substantial substantial substantial substantial substantial substant and substantial substant and substant and substantial substanti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
preventing blood coagulation by specifically targetting inhibitor to site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reduced potential for generalised haemorrhaging.                                              The MADS are specific to fibrin without fibrinogen cross-reactivity. They have increased binding to in vitro and in vivo thrombi. The MADS can be used in immunoassays for fibrin in the presence of fibrinogen or other proteins. They can be used as immunoaffinity ligands for the purification of fibrin. (Updated on 03-0CT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide is epitopic to fibrin, allowing anti-fibrin Abs to be raised without cross-reactivity to fibrinogen. They are particularly useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fibrin-specific monoclonal antibodies - lacking fibrinogen cross-reactivity, obtd. using peptide(s) comprising fibrin-specific epitopic

This sequence represents beta-peptide which was used to raise the monoclonal antibody 59BB. The antibody binds fibrin and may be used in the chimeric molecule of the invention. The chimeric molecule further comprises a thrombin inhibtor linked to the fibrin-binding antibody trapeting of hiradin and other thrombin inhibtors, which is nere potent than thrombin on its own. The epitope to which 59BB binds becomes available only after thrombin cleaves fibrinopeptide B. The chimeric protein may be used for preventing coaquiation of the blood. Anti-thrombin targetting can be esp. useful in highly thrombogenic situations such as coronary stent implantation and can be used as an adjunctive therapy with highly selective thrombin activity by the antibody which binds to thrombin but does not cross react with uncleaved fibrinogen. The selectivity of inhibition allows the total amount of thrombin inhibitor used to be substantially reduced, resulting in a reduced potential for generalised haemorrhaging. (Updated on 25-MAR-2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fibrin-binding antibody linked to thrombin inhibitor - useful for preventing blood coagulation by specifically targetting inhibitor to site
                                                                                                                                     Inhibitor; thrombin; chimeric molecule; fibrin-binding; antibody;
hirudin; monoclonal; 59D8; fibrinopeptide B; coagulation; P79;
coronary stent implantation; adjunctive therapy; fibrinogen; haemorrhage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a method of inducing proinflammatory effects in synovial or fibroblast cells comprising exposing the cells to a specific tetrapeptide (GPRP) peptide (I). (I) is used for inducing proinflammatory effects in synovial or fibroblast cells. An analogue of (I) is used for treating or preventing inflammation of a synovial joint or rheumatoid arthritis in a subject. (I) is used to identify a receptor for (I) comprising exposing several fibroblastic cells or synovial cells to (I).
                                                                                                                                    not with human fibrinogen. Specifically when the MAb reacts with ureatreated des-AABB fibrin the reaction is not inhibited by peptides corresponding to fibrinogen A-alpha-chain residues 17-26 (AAW11931), B-beta-chain residues 15-24 (AAW11932) or gamma-chain residues 312-324 (AAW11933). The MAb is useful in immunoassays for soluble fibrin in plasma samples (e.g. by sandwich immunoassay), particularly for the diagnosis of pathological conditions such as disseminated intravascular
                                                                                                                           novel monoclonal antibody (MAb) reacts with human soluble fibrin, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing proinflammatory effects in human synovial or fibroblast cells comprises using a specific tetrapeptide which can also identify a receptor to the tetrapeptide.
                                              Monoclonal antibody reactive with soluble human fibrin - but not fibrinogen, is useful for fibrin immunoassay in plasma specimens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Biotinylated fibrin polymerisation associated control peptide.
                                                                                            Example 3; Page 15; 32pp; Japanese.
                                                                                                                                                                                                                                                                                                 82.0%; Scc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a citrulline (Cit) containing polypeptide derived from all or part of the alpha- or beta-chains of fibrin by substitution of at least one arginine residue by Cit. The Cit containing polypeptides can be used for in vitro diagnosis of rheumatoid polyperthritis (RP), by detecting disease-specific autoantibodies, and therapeutically for neutralising the RP-associated autoimmune response. The present sequence is a fragment (residues 45-54) of the human fibrinogen beta chain precursor, which was used in an example from the
                                                                                                                                                                                                                                                                                                           citrulline-containing polypeptide from fibrin, useful for diagnosis treatment of rheumatoid polyarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monoclonal; antibody; human; soluble; fibrin; fibrinogen; urea-treated; des-AABB; A-alpha-chain; immunoassay; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bi:specific antibody useful for treating thrombotic obstructive diseases e.g. cardiac infarction - comprises antibrombus antibody variable region and anti-thrombolytic substance antibody variable region with no heavy chain constant region domains 2 and 3.
(I) Can identify, isolate and clone the cell receptor to which it binds. This is the amino acid sequence of a control peptide associated with the ihibition of fibrin polymerisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an N-terminal peptide of human fibrin. It was used in the production of bispecific monoclonal antibodies which are specific for fibrins, but do not bind fibrinogen, and and are specific for anti-thrombolytic substance. The compsn. contg. these Abs lacks the side effects of prior art Ab targetted thrombolytic agents and has enhanced thrombolytic actvity. (Updated on 25-MAR-2003 to correct PN

The peptide was used to raise antibodies to human fibrin. Monoclonal antibodies specific for fibrin are used in the production of bispecific monoclonal antibodies which also recognise truncated tPA muteins lacking the finger, EGF and Kringle 1 domains

Hybrid monoclonal antibody - used for prepn. of thrombolytic having drug increased thrombolytic activity and specificity and reduced reactivity to
                                                                                                                                                                                                                                                             Human fibrin beta-chain peptides A and B were synthesised and coupled to BASA for injection into mice. The peptides were used to raise antibodies to human fibrin. Monoclonal antibodies specific for fibrin are used in the production of bispecific monoclonal antibodies which also recognise truncated tPA muteins lacking the finger, EGF and Kringle I domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel peptides acting as modulators of fibrin fragment B activity for treating disease responding to stimulation or inhibition of cell proliferation or angiogenesis e.g. wound healing, ischemia, cancer and

The specification describes peptides which correspond to portions of fibrin fibrin/fibrinogen beta chain sequences, and act as modulators of fibrin fragment B activity, and in turn modulators of fibrin E effects. Such effects include induction of cell proliferation, angiogenesis, confidence in an expension of the peptides are used for wound heart muscle or limb replacement surgery. They are also used for treating ischaemia, reduction of scarring, and prevention of restenosis. The peptides may also be used for treating atherogenesis, rheumatoid arthritis, diabetes, renal disease, psoriasis, macular degeneration, or cancer. The peptides are also useful for modifying fibrin glues, and may be incorporated into a stent which is introduced into the arteries of the patient during an angioplasty procedure for preventing restenosis.

ABB78036-38 represent peptides derived from fibrin/fibrinogen beta chain sequences. The peptides are derived from the region where plasmin cleaves the molecule, and contain a Ceterminal Cys which does not appear in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                  Treating or preventing thrombin-induced coagulation of blood for treating a disease condition such as stroke, myocardial infarction, sickle-cell crisis or venous thrombosis by administering a SdrG protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for treating or preventing thrombin-
induced coagulation of blood by administering a SdrG protein. The method
is sued for preparing a composition for treating myocardial infarction,
stroke, sickle-cell crisis or venous thrombosis. The present sequence is
Staphylococcus epidermidis fibrinogen (Fg) Bbeta chain peptide used to
illustrate the method of the invention
                                                                                                                                                                                             Thrombin-induced blood coagulation; myocardial infarction; SdrG protein; sickle-cell crisis; venous thrombosis; stroke; therapy; anticoagulant; fibrinogen; Fg.

Treating or preventing thrombin-induced coagulation of blood for treating a disease condition such as stroke, myocardial infarction, sickle-cell crisis or venous thrombosis by administering a SdrG protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for treating or preventing thrombin-
induced coagulation of blood by administering a SdrG protein. The method
is sued for preparing a composition for treating myocardial infarction,
stroke, sickle-cell crisis or venous thrombosis. The present sequence is
Staphylococcus epidermidis fibrinogen (Fg) Bbeta chain peptide used to
illustrate the method of the invention
                                           Thrombin-induced blood coagulation; myocardial infarction; SdrG protein; sickle-cell crisis; venous thrombosis; stroke; therapy; anticoagulant; fibrinogen; Fg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

    S. epidermidis fibrinogen (Fg) Bbeta chain peptide, betal-25.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 25;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Reagent; site imaging; technetium-99M labelled; peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Scintigraph imaging agent specific binding peptide.

                                                                                                                                                                ď
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a reagent (A) for producing an agent for imaging sites in a mammal comprising a specific binding peptide (I) of 3-100 amino acids and, covalently linked to the side chain of an amino acid residue in (I), a radiolabel binding group (II). Also new are (1) scintigraphic imaging agents (SIA) containing (A) in which (II) is bound to a radiolabel; (2) kits for preparation of a radiopharmaceutical comprising (A) and enough reducing agent to label (A) with Technetium-99m. Depending on the nature of (I), SIA can be used to image e.g:
                                                              Reagents for preparing scintigraphic imaging agents - contg. technetium-
99M labelled peptide(s) contg. 3-100 aminoacid(s).
                                                                                                                   The sequence is that of a specific binding peptide used as part of a reagent for preparing a scintigraphic imaging agent for imaging sites within a mammalian body. In this the peptide is covalently linked to a radiolabel-binding moiety which is capable of forming a complex with a radiolsocope, pref. technetium-99M. (Updated on 25-MAR-2003 to correct field.) These are used for the therapy of local and generalised inflammation associated with infection, autoimmune reactions, rheumatic disease, immune system dysfunction or genetic disease, for the prevention and treatment of organ transplantation rejection reactions, arteriosclerosis, reperfusion transma, thrombotic disease and increased fibrin deposition associated with aging, or for the transport of other medicaments to human or animal endothelial cells. They may also be
tumours that express somatostatin receptors; leukocytes; atherosclerotic blaque; and deep vein thrombosis. Attachment of (II) to a sidechain avoids any interference with the specific binding proparties of (I) and makes possible derivatisation of cyclic peptides (which are more resistent to proceolysis). Images may be recorded only a few minutes after injection of SIA. This is the amino acid sequence of a peptide associated with the imaging methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       rheumatic disease; organ transplantation; arteriosclerosis; reperfusion trauma; thrombosis; cancer; antiinfammatory; antibacterial; immunosuppressive; antirheumatic; antiarteriosclerotic; vasotropic; thrombolytic; anticosqulant; cytostatic; antipsoriatic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                              New peptides are claimed which are leukocyte binding peptides having covalently bound to them a moiety which can bind a Tc-99m radiolabel. The peptides having Tc-99m bound to them are useful as scintigraphic imaging agents for imaging sites of infection and inflammation in the mammalian body, e.g. caused by ischaemia, inflammatory bowel disorder, arthritis or tumours. The present sequence is a specifically claimed example of such a peptide derived from fibrinopeptide B chain. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides are claimed which are leukocyte binding peptides having covalently bound to them a moiety which can bind a Tc-99m radiolabel. The opetides having Tc-99m bound to them are useful as scintifigraphic imaging agents for imaging sites of infection and inflammation in the mammalian body, e.g. caused by ischaemia, inflammatory bowel disorder, arthritis or theories. The present sequence is a specifically claimed example of such a peptide derived from fibrinopeptide B chain. (Updated on 25-MAR-2003 to correct PN field.)
                                                         Leukocyte binding peptide; fibrinopeptide B chain; scintigraphic imaging; inflammatiom site; technetium 99m.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Scintigraphic imaging agent for sites of inflammation - comprising leukocyte-binding peptide bound technetium-99m via binding moiety.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a composition (C) comprising a radiopharmaceutical precursor and a stabiliser selected from hydrophilic thioether (I) and/or hydrophilic 6-hydroxy-chroman derivative (II). Also described: (1) stabilising a radiopharmaceutical comprising; combining the radiopharmaceutical precursor with (1) and/or (II) in a container, and adding a radionuclide to the container; and (2) a kit comprising a sealed vial containing the radiopharmaceutical precursor, and (I) and/or (II). (C) can be used to increase the shelf life of diagnostic and therapeutic radiopharmaceutical precursors in nuclear medicine. The stabilisers maintain the radiochemical purity of the radiopharmaceutical containing a vide variety of radiopharmaceutical. (C) is suitable for stabilishing a wide variety of radiopharmaceuticals. The present sequence represents a specifically contained targeting moiety peptide for a composition from the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention decribes a composition comprising a radiopharmaceutical precursor and a stabilising amount of a hydrophilic thioether. The composition is useful as stabiliser for radiopharmaceutical compositions for use in diagnosis and therapy. The composition is particularly useful for increasing the shelf life of diagnostic or therapeutic radiopharmaceuticals. This the amino acid sequence of a hydrophilic thioether used in the method of stabilising radiopharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                radiopharmaceutical precursor; hydrophilic 6-hydroxy-chroman derivative; stabiliser; radiopharmaceutical composition; diagnosis; therapy; shelf life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                  The invention describes a composition comprising a radiopharmaceutical precursor and a hydrophilic 6-hydroxy-chroman derivative. The composition is useful as stabilisers of radiopharmaceutical compositions for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytokine, cell proliferation, cell differentiation, growth factor, opoiesis regulation, tissue growth; immunomodulator; activin;
                                                                                                                                                                                                                                                                     diagnosis and therapy. The composition is particularly useful for increasing the shelf life of diagnostic or therapeutic radiopharmaceuticals. This is the amino acid sequence of a peptide used in the stabilisation of radiopharmaceutical compositions.
                                                                                                 Compositions, useful as stabilizers, or for increasing shelf life, of radiopharmaceuticals for use in diagnosis or therapy, comprises radiopharmaceutical precursor, hydrophilic thioether and hydrophilic 6-hydroxy-chroman derivative,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial;

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides.

Conclectide of the invention, methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence of potential therapeutic applications. The polypeptides of the invention may have various activities, into their probable biological activities, and hence differentiation activities, sem cell growth factor activity; lampare activity; insue growth activity; concentration activities, repeated activities, concentration and activities, or may or activities; or may or activities; and mencertain and activities, polypeptides and mucleotides of thrombolytic activities, receptor or ligand activities; or may be used in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy, Such conditions include cancers, hematopotetic disorders (e.g., metopoted call activities propertions or ameliorating medical carterial ischemia, bone disorders (e.g., metopotes), chronic inflammatory conditions (e.g., asthma or arthitis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischemia, bone disorders (e.g., metopotes), will exhemia benearial benearial and disorders (e.g., metopotes) will carterial and fungal infections in addition to immune disorders to manipulate stem cells incitive may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorder set or equation and engage to manipulate stem cells in our properties and prope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent of or puse in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to easies also useful for producing the proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon stimulation; as anti-inflammatory agents; and in treatment of leuxaemias. AAUS9510-AAUS3304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a polypeptide encoded by one of a large number of 5. ESTB derived from mRNAs encoding secreted proteins. The 5. ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences derived from the STB are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, vaccination, gene therapy, nutritional supplement,

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell prollferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, insue growth factor activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a polypeptide encoded by one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where included. S' ESTs are derived from mRNAs with intact 5' ends and earling cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 13; SEQ ID NO 4231; 71pp + Sequence Listing; English.

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAKS2582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
 mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Xu C, Cao Y;

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A purincleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine of autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflections any also be used in genetic mapping, in identifying individuals confluent may laso be used in genetic mapping, in identifying individuals confluent may be used in genetic mapping, in identifying individuals confluent may be present sequence represents a dithp protein of the gene therapy. The present sequence represents a dithp protein of the gene therapy. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conclus may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be considered to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp confections also be used in genetic mapping, in identifying individuals from minute biological samples in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers a dithp protein of the invention. Note: The sequence represents a dithp protein of the invention, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gietzen D;

A selected from one of the 2722 sequences defined in the specification. A diagnostic of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflues may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nuclectide polymorphisms, as molecular weight markers, and for somatic or germline continue the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp infections caused by virus, bacteria, fungi or parasite. The dithp conjuminate biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp on molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A profit of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine cutoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp crow minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline conflection. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

The invention relates to a composition comprising several CDNAs that are differentially expressed in a liver disorder. The composition is useful to the treating liver disorder such as hyperlipidaemia, hyperension, type II diabetes, tumnours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the cDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the cDNA with several of molecules or compounds under conditions to allow specific or binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and conditions is useful for detecting and composition is useful for detecting and composition is useful for detecting and committed formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid sequence of a protein encoded by a cDNA differentially expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition comprising several cDNAs that are differentially expressed in treated human C3A liver cell cultures, useful for treating liver

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4232, Application US/09513999C
| Patent No. 6783961|
| GENERAL INFORMATION:
| APPLICANT: Dumas Milne Edwards, J.B.
| APPLICANT: Duclett, A.
| APPLICANT: Duclett, A.
| APPLICANT: Giordano, J.Y.
| TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.
| PILE REPERENCE: 59.US.RED
| CURRENT APPLICATION NUMBER: US/09/513,999C
| CURRENT PLING DATE: 1999-02-26
| PRIOR APPLICATION NUMBER: US 60/122,487
| RING RELIGIOR DATE: 1999-02-26
| NUMBER OF SEQ ID NOS: 36681
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          COCATION: 1...3

OTHER INFORMATION: /label= Picolinoyl
OTHER INFORMATION: /note= "The amino terminal residue is
OTHER INFORMATION: /note= "Teamino terminal residue is
OTHER INFORMATION: pytidine-2-carbonyl; the thiol of the cysteine
OTHER INFORMATION: residue is protected by an acetoamidomethyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

US-09-270-767-54374

Sequence 54374, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster:
FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DARE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 54374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

A;Title: A unique proteolytic fragment of human fibrinogen containing the Aalpha COOH-te:
A;Reference number: A37117; MUID:90337977; PMID:2143188
A;Contents: annotation; hementin cleavage site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Note: hementin, a protease from Haementeria ghilianii, the giant South American leech, C; Comment: The conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves istation sites responsible for the formation of the soft clot.
C; Comment: The soft clot is converted into the hard clot by factor XIIIa (fibrin-stabilized) and between alpha chains (weaker) of different monomers.
C; Comment: All fibrinogen chains are synthesized in the liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A;Cross-references: GDB:119130; OMIM:134830

C;Complex: The fibrinogen molecule is a hexamer containing two sets of alpha (see PIR:FGF) ins are contained in the core. Two three-chain coiled coils emerge from this core and core from the distal domain nodes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Lymuction: fibrinogen cleaved by thrombin yields monomers that are polymerized into farbathway: blood coagulation
